NEW ABSTRACT

A recording arrangement receives reception information including program, picture and/or sound information in a receiving channel of a television program. A detector detects the received program information which characterizes the start and end times of the television programs. A recorder is adapted to record the picture and/or sound information on a record carrier from a recording start time till a recording end time. A recording controller which, when a user of the recording arrangement has defined the recording start time and the receiving channel for a recording, is adapted to propose the end determined by the detector as the recording end time for the recording of the television program that can be received in the receiving channel.
